*Refer to accompanying document, Protura 1.7.4 Errata, for Validated Interface information.*

## INTENDED USE / INDICATIONS FOR USE

The Protura Couch is intended to support and aid in positioning a patient during radiologic, radiation therapy, and other medical procedures. The Protura Couch adds Pitch and Roll to the normal X, Y, Z and Yaw motions. The additional Pitch and Roll make patient alignment simpler without the need to manually move the patient on the table.

The Protura Couch Software is intended to interface between record and verify systems, linear accelerator (Linac) software systems, Linac safeguard systems, and/or image guidance systems and the Protura Couch. The Protura Couch Software is also capable of operating the Protura Couch (6 Degree Axis Couch).

The Protura Couch is suitable for use in Radiation Oncology Treatment vaults.

The Protura Robotic Couch System is comprised of a robotic couch, a software package to control the motion of Protura, and an alignment fixture to assure the software calculates where isocenter is with respect to Protura.

Protura enables the facility to deliver robotic corrections for treatments such as 3D Conformal, IMRT, SRS or SBRT. Available interfaces include patient demographics, Linac Pedestal Location, IGRT move capture, and Remote Control. Protura software stores shift data for each patient which can be printed or exported in PDF format.

Acceptance testing and regular QA is strongly encouraged to assure the product is performing to specifications.
WARNING

- Federal (United States) law restricts this device to sale by or on the order of a physician.
- Prior to use, read and understand all warnings.
- Prior to use, review TG40¹, TG53², TG142³ and other pertinent radiation therapy treatment standards and incorporate those methods into your clinical practice to ensure accurate treatments and expected results.
- Before use, you should be a trained radiation oncology medical professional.
- This product is intended for trained users of the Protura system. This product should not be used without a thorough understanding of the general practice and guidelines regarding IGRT and 6DOF robotic treatment delivery. Personnel should receive training prior to unsupervised operation of the system. For more information, contact Customer Support or your local distributor.
- Do not operate Protura if device appears damaged. If problems exist, contact Customer Support or your local distributor immediately.
- Protura software must be launched and running to enable all safety measures or precautions.
- Ensure Protura is in a position suitable for treatment prior to initiating treatment of a patient.
- When operating Protura from outside of treatment room, camera systems should be utilized to visually assure patient safety.
- All values imported from another system should be verified for accuracy.
- Use of this equipment adjacent to or stacked with other equipment should be avoided because it could result in improper operation. If such use is necessary, this equipment and the other equipment should be observed to verify that they are operating normally.
- Use of accessories, transducers and cables other than those provided by the manufacturer of this equipment could result in increased electromagnetic emissions or decreased electromagnetic immunity of this equipment and result in improper operation.
- Portable RF communications equipment (including peripherals such as antenna cables and external antennas) should be used no closer than 30 cm (12 in.) to any part of the Protura couch, including cables specified by the manufacturer. Otherwise, degradation of the performance of this equipment could result.

The user is responsible for ensuring the application and use of the Protura does not compromise the patient contact rating of any equipment used in the vicinity of, or in conjunction with, the system.

The use of accessory equipment and/or hardware not complying with the equivalent product safety and EMC requirements of this product may lead to a reduced level of safety and/or EMC performance of the resulting system. Consideration relating to the choice of accessory equipment used with this product shall include:

- The use of the accessory in the patient vicinity.
- Evidence the safety certification of the accessory has been performed in accordance with the appropriate IEC 60601-1 and/or IEC 60601-1-1 Harmonized National Standards.
- Evidence the EMC certification of the accessory has been performed in accordance to the IEC 60601-1-2 Harmonized National Standards.
- The original language of this instruction is English.

NOTE

Observe all safety precautions recommended by the accessory equipment manufacturer in the user documentation provided with the equipment.

Keep this manual with Protura for quick reference as required.

NOTE

The emissions characteristics of this equipment make it suitable for use in industrial areas and hospitals (CISPR 11 class A). If it used in a residential environment (for which CISPR 11 class B is normally required) this equipment might not offer adequate protection to radio-frequency communication services. The user might need to take mitigation measures, such as relocating or re-orienting the equipment.

In the event of an electro-magnetic disturbance, the Protura Robotic Couch system will not experience uncontrolled movement (translation and rotational movements) or damage, however a disturbance may require the Protura hardware to be rebooted if it is unresponsive.
2 Getting Started

2.1 Hardware Overview

I. Buttons

On button (Green):
Turns system on. The light will be lit if the system has power applied. When the On button is pressed, it will light up and Protura will begin to reboot. Once Protura is ready to use, the green LED will light up. The system takes approximately 25 seconds to reboot. Protura will need to be initialized prior to use.

Off / STOP button:
Turns Protura hardware off. This can be used to stop Protura in case of an emergency.

Load / Unload button:
Moves Protura to the Load / Unload position to make it easier for patients to get on and off the couch pedestal. Load position height is 5cm below the Zero position. Load / Unload button must be held for one second to activate the move and prevent an unintentional move.

Zero Position button (Blue):
Moves Protura to Zero Position. When in Zero Position, Protura can be calibrated and given direct commands to move based on IGRT results. Zero Position button must be held for one second to activate the move and prevent an unintentional move. This button can also be used to initialize Protura. When Protura is in Zero Position, this button will be lit blue.

WARNING

- Use Off / STOP button to stop Protura in case of emergency.
- Power Off / STOP button turns Protura hardware off, not the power supply.
- Take care to avoid pushing Load / Unload or Zero Position button unintentionally.

NOTE

When system is first turned on, Protura must go to Zero Position before going to Load / Unload.

In the Load / Unload position, Protura must return to Zero Position before initiating patient movements.

When emergency stop is configured, the system emergency stop will stop Protura once activated.
II. Lights

Error light (Red):
Indicates system error. User should examine Protura software for more specific indications of error code being received. If light is on while patient is on the couch, move Protura to Zero Position and then to Load / Unload position. If Protura does not respond, press Off / STOP button to turn off and press On button to reboot. If the light comes back on after Protura has rebooted, contact Customer Support or your local distributor immediately.

Motion light (Yellow):
Indicates Protura is in motion.

Ready light (Green):
Indicates Protura system has booted properly and is ready to accept commands. It is possible for the On button to be on but the Ready light to be off.

WARNING
- Do not operate Protura in the event of software warnings or rear panel Error light is lit to indicate a system error.
### 2.1.1 Range of Motion

Protura software controls the Protura Robotic Couch system. This software/hardware combination allows for highly-accurate patient positioning for targeted treatment.

Prior to using Protura, the system must be configured for use. Start by accessing the **System Settings** window (refer to Section 8.1 System Settings).

**NOTE**

Protura software limits rotational shifts to 5 degrees. Protura hardware may limit rotational shifts to 3 degrees or less based on pivot point location and magnitude of other shifts. Prior to executing move, Protura will notify user if proposed move request exceeds limits.

**WARNING**

- Take care when moving Protura or linac gantry to ensure patient and system collisions are avoided.
- Take care when moving Protura to ensure patient is immobilized as necessary.
2.2 Software Overview

Main Menu Window. The Protura application main window includes:

I. Main Menu Bar
II. Patient Data Panel
III. Couch Position Panel
IV. Couch Button Panel
V. Status Area

Every window in Protura allowing motion provides a STOP button. Be prepared to activate this during motion, if necessary.

I. Main Menu Bar

Additional functionality is accessed in the Main Menu Bar. Options appear grey when unavailable or action is already achieved.

File: Contains the ability to create new patient record, open patient record, close a currently loaded patient record, delete patient record, import patient record and exit program.

Tools: Allows user to configure system, import configuration, export configuration, run a test procedure, align the pedestal, or override an IGRT setting.

Reports: Generates patient reports.

Help: Provides Protura information.

NOTE: Every window in Protura allowing motion provides a STOP button. Be prepared to activate this during motion, if necessary.
II. Patient Data Panel

- **MR**: Displays patient's MR information. For MR entries exceeding 64 characters in length, the system will display an ellipsis (...) to indicate the data has been truncated.

- **Name**: Displays patient's name. *(Last Name, First Name)* For patient names exceeding 30 characters in length, the system will display an ellipsis (...) to indicate the data has been truncated.

- **Edit Patient button**: Refer to Section 5.1.3 Edit Patient Record.

- **Add button**: Adds a course or field.

- **Course**: Course data is stored with patient data and available when patient is loaded. Refer to Section 5.1.4 Define Course Identifiers.

- **Field**: Field Identifier. *This field accepts up to 30 characters.* Field data is not stored with patient data. The value entered here is written to the Move Report only (refer to Section 7.1 Daily Move Report and Section 7.2 Patient Move Report).

- **Move Speed**: Displays move speed of the currently-loaded patient. *(Low, Medium and High)*

- **IGRT**: Refer to Section 8.3 IGRT Coordinate System Configuration.
III. Couch Position Panel

This panel contains four distinct sections:

- **Keypad** is accessible using a computer mouse or touch screen keys for changing field focus and adjusting field values. Use the Import button to import patient information and IGRT data.

- **Current Couch Pedestal Location** is used to capture current coordinates and rotation of the couch pedestal. Locking the pedestal values sets the pivot point at isocenter in preparation for IGRT adjustments.

- **Proposed Values** is used to enter IGRT target coordinates. Colored text (shown in green in image below) serves as an indicator for displayed values.
  - **White text**: Displayed values are unchecked.
  - **Green text**: Displayed values are possible with the hardware.
  - **Red text**: Displayed values are NOT possible with the hardware. Select the Reduced Shift button or the Move button to view potential values.

- **Current Values** displays current Protura position. Current Values may not exactly match Proposed Values due to angle order and pedestal rotation corrections.
  - **0.00 Values**: Displayed prior to initiating motion.
  - **Current Relative Positions**: Displayed following successful motion.
  - **Red Double Dashes**: Displayed when the current position of the couch is unknown. *(i.e., Couch stops prior to reaching the set position)*.

![Couch Position Panel Diagram](image-url)
IV. Couch Button Panel

This panel contains buttons to trigger couch movement.

- **Load / Unload button**: Moves Protura to the Load / Unload position to make it easier for patients to get on and off the couchtop. Load position height is 5cm below Zero Position. When in Load / Unload position, Protura must return to Zero Position before initiating motion.

- **Zero Position button**: Brings couch to the Zero Position. When in Zero Position, the couchtop can be aligned and Current Couch Pedestal Location can be locked prior to giving direct commands to move based on IGRT results.

- **Move button**: Initiates motion based on IGRT results.

- **STOP button**: Ceases Protura motion.

V. Status Area

Located at the bottom of the main window.

- **Message Bar**: Indicates Protura movement status.

- **Status Bar**:
  - IGRT System: Data type (Offset or Absolute) and Pedestal Rotation Compensation, PRC when active *(refer to Section 8.3 IGRT Coordinate System Configuration)*.
  - Protura Version information.
  - Couch Pedestal Alignment date.
  - Linac connection status, if applicable.
  - Protura hardware connection status.
  - Remote Control connection status, if applicable.
3.1 Alignment Fixture

1. Unfold fixture.

2. Tighten thumb nuts.

3. Place alignment block.

4. Install onto Protura, slide under receiving bracket and align on pins.

5. Ensure alignment fixture is properly seated on both sides and white is not visible at the junction of mount point on alignment fixture prior to performing alignment.
3.2 Isocenter Alignment

The Protura system features a virtual pivot point. Any corrections to the couch position *(including pitch, yaw and roll)* are executed with the isocenter as the virtual pivot / reference point.

To set the virtual pivot point, Protura hardware must know where the isocenter is in relation to its own pivot point.

**WARNING**

- Protura alignment assures the virtual pivot point will be calculated properly with respect to the linac isocenter. Failure to assure there has been no drift over time can lead to inaccurate shifts and potential mistreatment. Since there are no clear AAPM recommendations for couch pedestal to isocenter QA measurements, the user is advised to routinely perform Protura alignment until the stability is assessed over time.

**NOTE**

CIVCO strongly recommends the user calibrate their laser system prior to performing this procedure with Protura.

1. From the Tools menu, click Align Pedestal. This menu option is not available if a patient file is open.

Enter Password window displays. There are two methods to enter password.

- Enter password *(default password is CeePro, refer to Section 8.1 System Settings)*. Click OK. To leave Enter Password window without making changes, click Cancel.

- Click the keyboard icon. Enter password using a mouse or touch screen *(default password is CeePro, refer to Section 8.1 System Settings)*. Click OK.
2. Follow instructions on screen:
   1. Click **Zero Position**.
   2. Set couch pedestal so there is no rotation.
   3. Attach alignment fixture (*refer to Section 3.1 Alignment Fixture*).
   4. Adjust pedestal (*NOT Protura*) so the IGRT block at the end of the fixture is aligned to room lasers or light field.
   5. Perform kV image to verify IGRT block at isocenter.
   6. Record pedestal position values in millimeters or centimeters (*as defined in Section 8.2 Couch Pedestal Configuration*) into Protura alignment window. The location of the pedestal will be used from now on to calculate the virtual pivot point location.

3. Click **Update Alignment Date** to update alignment date if the new calibration has the same values as the previous alignment.

4. Click **Save**.

5. Exit and re-launch the Protura software.
Test Procedure moves Protura hardware in 6DOF to test range of motion. The Test Procedure uses Protura Default Speed (refer to Section 8.1 System Settings). Test Procedure may take several minutes to complete.

Prior to conducting Test Procedure:
- Ensure the Protura is in a safe position.
- Ensure patient record is not open.
- Ensure there is no patient on couchtop.

1. From the Tools menu, click Test Procedure....

2. Click Start to begin Test Procedure. Test Procedure to Begin message box will be displayed.

3. Click OK. Test Procedure begins.
Test Procedure displays the current action.

While Test Procedure is in progress, the Stop button may be used to stop Protura movement and end Test Procedure. When Stop button is pressed, Protura will pause for 5 seconds. Test Procedure Aborted window will be displayed. Click OK to move back to Zero Position.

4. Once Test Procedure is complete, results will appear in the Results text panel.

NOTE If Results show an error/failure, click Start to return Protura to Zero Position and run test procedure again. If Test Procedure continues to fail, contact CIVCO Customer Service.

5. To close Results window, click Cancel.
5 Using Protura

5.1 Managing Patient Information

Patient records can be created in advance of treatment or during import of IGRT data. Read and understand Sections 2 Getting Started and 3 Alignment before using Protura.

**WARNING**

- If pedestal rotation (couch kick) is desired for treatment, be sure to select and verify correct settings for IGRT system. Protura can make corrections to 6DOF information to account for pedestal rotations. However, if IGRT system already takes this into account before providing recommended shifts, correction in Protura is not needed.
- Execution of QA tests is required during Protura installation and IGRT system configuration to assure proper results. Failure to do so can result in patient mistreatment. Always verify shifts through re-imaging and verification and IGRT.
- Protura does not account for patient movement. A confirmation image is recommended to ensure patient and target are in the desired location before treatment is delivered.

5.1.1 Create Patient Record

When creating a patient record, any value entered exceeding the maximum character limit will not be displayed. MR Number, Last Name and First Name are required fields to save the patient record. Once data is saved, a tool tip is available to display.

1. From the **File** menu, click **New Patient**... or select [Ctrl]+N on the keyboard.

![New Patient Window](image)

2. Enter **MR Number**. *This field accepts up to 64 characters and is case sensitive.*

**NOTE**

The MR Number must be unique.

The MR Number cannot be changed once the patient record is saved.

3. Enter patient’s **Last Name**. *This field accepts up to 30 characters.*
4. Enter patient’s **First Name**. *This field accepts up to 30 characters.*
5. **Course** values are optional (refer to Section 5.1.4 Define Course Identifiers).
6. Click **Clear** to clear data from all fields, **Save** to save patient record, or **Cancel** to close the window without saving changes.
5.1.2 Open Patient Record

1. From the File menu, click Open Patient... or select [Ctrl]+O on the keyboard.
2. Click column heading to sort patient list. Click column heading again to switch from ascending sort to descending sort.

3. Filter Patient List text boxes filters patient list to show only those records which contain value entered in corresponding column. The filter text boxes can be used in combination.

For example, entering do in Last Name text box and jo in First Name text box, Patient List will filter these records:
4. Select the row of the patient to be opened.
5. Click Load or double-click the patient to load into Patient Data Panel on the main window or click Cancel to close the window without loading a patient.

6. After the patient is loaded, the Current Couch Pedestal Location values will be shaded with a red background and values are black. If the patient has been treated before, the last couch positions used will automatically be loaded.

**NOTE**
If the values are out of range, the Current Couch Pedestal Location values will be shaded with a red background and the values will be white until corrected.

7. These values must be confirmed as accurate before pedestal can be locked and movement can begin. Select each field and update the value, if necessary. Click Lock Pedestal Values. When values need to be changed, click Unlock Pedestal Values.

**NOTE**
If Couch Pedestal Configuration thresholds are exceeded, a warning message will appear (refer to Section 12 System Messages).

### 5.1.3 Edit Patient Record

1. Select Edit Patient from Patient Data Panel.

2. Update patient data as necessary.
   - MR Number is a fixed field and cannot be edited.
   - Click Clear to clear data from all fields.
   - Course values are optional (refer to Section 5.1.4 Define Course Identifiers).

**NOTE**
With Varian interface enabled, checkbox is available to indicate if Patient Treatment Uses Protura.

3. Click Save to save the patient record or click Cancel to close the window without saving changes.
5.1.4 Define Course Identifiers

Course identifiers can be defined when adding patient, editing patient, or through the main window after opening a patient.

1. Click Add.

2. Enter a Course value. *This field accepts up to 30 characters and is case sensitive.*

3. Click Add to add Course value to the Course drop-down list and close the window or click Cancel to close the window without saving changes.

   **NOTE**
   
   A course must be defined and selected to ensure patient setup is not outside of pedestal threshold value.

   Once a course is added, it cannot be deleted or renamed.

4. Enter a Field value *(optional).* Field value will be stored with move data.

5.1.5 Close Patient Record

1. From the File menu, click Close Patient. The patient data panel is cleared. Selecting Load / Upload button will also close patient record if there is no active Remote Control connection.

   **NOTE**
   
   Some application functions cannot be performed while a patient is loaded in the Patient Data Panel. For example, the System Configuration settings cannot be changed until the Patient is closed.
5.1.6 Delete Patient Record

1. From the File menu, click **Delete Patient...** or select [Ctrl]+D on the keyboard.

Filter Patient List: Filters patient list to show only those records which contain value entered in corresponding column. The filter text boxes can be used in combination. For example, entering do in Last Name and jo in First Name, Patient list will filter these records:

2. Select patient(s) rows to be deleted.

Multiple contiguous rows can be selected by using [Shift]+click. Multiple non-contiguous rows can be selected by using [Ctrl]+click.

3. Click **Delete** to delete selected patient record(s). A window will display to confirm deletion, click **OK**. Or click **Cancel** to close the window without deleting any patients.

**NOTE**
Deleting patient record(s) removes all history and recorded data for patients selected and cannot be recovered.
5.2 Patient Moves

Protura is designed to accurately move patient to desired treatment position using IGRT data.

NOTE
In order to be in a position to make corrections, the Protura MUST be moved to **Zero Position** BEFORE imaging is performed. Protura is unable to make corrections from the **Load / Unload Position**.

In order to ensure patient does not move during treatment, CIVCO recommends patients be immobilized on couchtop. For more information on immobilization products, please contact your local CIVCO representative.

5.2.1 Change IGRT System

The IGRT system can be changed from within a patient record.

1. In **Patient Data Panel**, select the **IGRT** system from the drop-down menu.

![Patient Data Panel](image)

5.2.2 Change Move Speed

Current **Move Speed** can be overridden for a patient on a per-patient and per-treatment basis *(refer to Section 8.1 System Settings)*.

The overridden **Move Speed** value is stored with each patient move. When the patient is reloaded, the most recent **Move Speed** value is used.

In **Patient Data Panel**, select desired **Move Speed** from drop-down list. The **Move Speed** values are Low, Medium and High.

![Patient Data Panel](image)

**NOTE**
Patients may react differently to the various speeds, work with your patient to select appropriate and comfortable speed. Increased **Move Speed** may require more rigid immobilization, both for comfort as well as for assuring the patient is not moved inadvertently.
5.2.3 Couch Pedestal Location

1. Enter Current Couch Pedestal Location values.

   ![Current Couch Pedestal Location](image)

   A warning message will appear if values entered into Current Couch Pedestal Location exceed defaults set for thresholds in Couch Pedestal Configuration tab from the patient's last move for the selected Course. Click Yes to proceed with current values.

2. Click Lock Pedestal Values button.

   ![Lock Pedestal Values](image)

3. When Pedestal Values are locked, the Move button becomes active.

   ![Move](image)

5.2.4 Move Patient - Proposed Values

The Proposed Values section allows user to enter desired 6DOF adjustments for a patient move with Protura.

1. Import or manually enter corrections into Proposed Values. Default values are zero. Changes will be displayed in Current Values.
2. Use Prev or Next to move focus to the first Proposed Values field or select field directly with mouse or by touching field on touch screen display.

3. Enter target values with on-screen number pad or keyboard.

4. Click Move.

WARNING

- When a relative move is interrupted, the Proposed Values do not reflect the remaining move position. Users must confirm the patient is in the correct position prior to starting treatment.
5.2.5 Move Out of Range

Protura will determine if coordinates defined in **Proposed Values** are reachable based on current Protura and pedestal position.

If **Proposed Values** are not reachable but can be made with a set of reduced values, a message is displayed offering the option to use those reduced values or reposition the patient. Select the appropriate button based on desired outcome.

![Image of Proposed Values message]

If **Proposed Values** are too large and cannot be made, a message is displayed indicating the patient needs to be repositioned and new IGRT coordinates calculated. Select the **Repositioned Patient** button after patient has been moved.

![Image of Too Large message]
5.2.6 Move Successful

A confirmation message will be displayed at the completion of each successful move.

1. **Move Successful** message window will be displayed. Click **Yes** if patient is ready for treatment. Click **No** to return to **Current Couch Pedestal Location** panel to make additional adjustments.

![Move Successful Window]

2. If **Yes** is selected, **Ready for Treatment** message window will be displayed and Protura is locked for treatment.

![Ready for Treatment Window]

3. When treatment delivery is complete, click **UNLOCK**.
6.1 General Protura Workflow

This section details workflow for general positioning for treatment without linac integration.

WARNING

- When the pedestal is moved from the locked position prior to a secondary Protura rotation, a confirmation image is required after the secondary Protura rotation to verify any residual error is within treatment tolerance.

1. With Protura in Load / Unload position, open patient in Protura system.
2. Filter Patient List by First Name, Last Name and/or MR Number and select patient record. Click Load.
3. Escort patient into treatment room and immobilize patient on couchtop as defined in treatment plan.

![Zero Position Image]

5. Move pedestal into treatment position using laser marking system, noting pedestal X Y Z coordinates.
6. Select each field of Current Couch Pedestal Location screen to enter coordinate value or to confirm displayed value from previous treatment.
7. Select Lock Pedestal Values to confirm pedestal coordinate values.

![Current Couch Pedestal Location Screen]

8. Exit treatment room.
9. Use IGRT system to calculate necessary shifts to place target at desired location. Enter values into Protura.

![Reduction Shifts Screen]
WARNING

• Prior to selecting the Move button, verify pedestal and shift values in Protura match the IGRT system values.

10. Click **Move** button to move Protura into treatment position.

11. Move Successful message will be displayed. Click **Yes** to lock Protura for treatment.

NOTE

A confirmation image is recommended to ensure patient and target are in the desired location before treatment is delivered.

12. Ready for Treatment message will be displayed. System is now locked and ready for treatment.

13. Follow protocol for treatment delivery.

14. Upon completion of treatment at current isocenter location, enter treatment room.

15. Select **UNLOCK** in Protura software.

16. For treatment delivery at multiple isocenter locations on current patient:
   1. Move Protura to Zero Position.
   2. Select Unlock Pedestal Values.
   3. Repeat workflow beginning with step 5.
17. When treatment is complete, select **Load / Unload** button. Protura will move to **Load / Unload** position and automatically close patient record.

18. Patient may exit treatment room.

19. Generate **Patient Move Report** in Protura software at completion of treatment. Save report in patient file as defined in site protocol. Reports can be automatically generated upon closing of patient record and stored in defined directory location. *Refer to Section 7.2 Patient Move Report and Section 8.1 System Settings.*

### 6.2 Protura Workflow - Varian Integration without Pedestal Shifts

This section details workflow with Varian integration and 6DOF with Protura. In the Varian Interface tab, **Division of Movement** must be set to **All 6 degrees Protura**. *Refer to Section 8.5 Varian Interface Settings.*

**WARNING**

- Execution of QA tests is required following any updates to Varian 4DTC, OBI, ARIA, or MOSAIQ systems. Verify shift values calculated by Protura match the shifts generated in the OBI System.
- When making Protura shifts with Varian interface enabled, do not Apply Shifts to pedestal with the OBI System or other non-Protura systems. Protura will not update with new pedestal location, thus rotations will not occur at room isocenter and double shifts are possible.
- Ensure patient record in Varian 4DTC System matches patient record in Protura.
- Treatment authorization to Varian 4DTC System will remain active until Clear Mode Up is selected.

1. With Protura in **Load / Unload** position, open patient in Varian 4DTC System or MOSAIQ.
   - If selected patient exists in Protura database, patient record will automatically launch in Protura.
   - If selected patient does not exist in Protura database, **New Patient** message will be displayed. Click **Yes** to indicate patient will be treated using Protura. Patient record will be added to Protura and will automatically launch.

**NOTE**  
If patient is not treated with Protura, refer to Section 6.4 Protura Workflow - Varian Integration without Protura.

2. In Varian 4DTC System, **Mode Up** the setup field.

3. Escort patient into treatment room and immobilize patient on couchtop as defined in treatment plan.

4. Move Protura to **Zero Position**.
5. Align patient to external markers.
6. Exit treatment room.
7. Calculate shifts with **OBI System** to align target.
8. In **OBI System**, click **Save Match** and shift values are saved.

</table>

**NOTE**
Protura software calculates shift values, gets pedestal location from the Varian 4DTC System (with a pedestal 0,0,0 move request), and locks the pedestal in Protura software.

9. Protura displays shift values and **Move** button becomes available.

**WARNING**
- Prior to selecting the **Move** button, verify pedestal and shift values in Protura match the IGRT system values.

10. Click **Move** button to move Protura into treatment position.

11. **Move Successful** message will be displayed in Protura system. Click **Yes** to lock Protura for treatment.

**NOTE**
A confirmation image is recommended to ensure patient and target are in the desired location before treatment is delivered.

12. **Ready to Authorize** message will be displayed. System is now locked and ready for treatment.
13. In **OBI System**, click **Cancel** and select **No** to apply shifts.

14. In **Varian 4DTC System**, click **Cancel** to pedestal move request 0,0,0, which is sent from Protura to access pedestal location. Select **Yes** to cancel pedestal shift request.

15. In **Varian 4DTC System**, Mode **Up** treatment field.

**NOTE** Protura will lock during treatment with no option to unlock. Unlock option will be available at completion of each treatment field.

16. Follow treatment delivery protocol.

17. Repeat **STEPS 15-16** for all treatment fields at isocenter location.

18. Upon completion of treatment at current isocenter location, enter treatment room.
19. For treatment delivery at multiple isocenter locations on current patient:
   1. Select **UNLOCK** in Protura software.

   ![Unlock Button]

   ![Zero Position]

   3. Select Unlock Pedestal Values.

   ![Unlock Pedestal Values]

   4. Repeat workflow beginning with step 5.

20. **Close** patient in **Varian 4DTC System** and/or **MOSAIQ**.

21. Select **UNLOCK** in Protura software.

22. When treatment is complete select **Load / Unload** button. Protura will move to **Load / Unload** position and automatically close patient record.

   ![Load / Unload]

22. Patient may exit treatment room.

23. Generate **Patient Move Report** in Protura software at completion of treatment. Save report in patient file as defined in site protocol. Reports can be automatically generated upon closing of patient record and stored in defined directory location. Refer to Section 7.2 Patient Move Report and Section 8.1 System Settings.
6.3 Protura Workflow - Varian Integration with Pedestal Shifts

This section details workflow with Varian integration when Protura software applies shifts to Protura hardware and Varian pedestal. **Division of Movement** configuration must be set to **Translation Pedestal / Rotations Protura** OR **Translation and Yaw Pedestal / Pitch and Roll Protura**. Refer to Section 8.5 Varian Interface Settings.

**WARNING**

- Execution of QA tests is required following any updates to Varian 4DTC, OBI, ARIA, or MOSAIQ systems. Verify shift values calculated by Protura match the shifts generated in the OBI System.
- When making Protura shifts with Varian interface enabled, do not Apply Shifts to pedestal with the OBI System or other non-Protura systems. Protura will not update with new pedestal location, thus rotations will not occur at room isocenter and double shifts are possible.
- Ensure patient record in Varian 4DTC System matches patient record in Protura.
- Treatment authorization to Varian 4DTC System will remain active until Clear Mode Up is selected.

1. With Protura in **Load / Unload** position, open patient in **Varian 4DTC System** or **MOSAIQ**.
   - If selected patient exists in Protura database, patient record will automatically launch in Protura.
   - If selected patient does not exist in Protura database, **New Patient** message will be displayed. Click **Yes** to indicate patient will be treated using Protura. Patient record will be added to Protura and will automatically launch.

2. In **Varian 4DTC System**, Mode Up the setup field.
3. Escort patient into treatment room and immobilize patient on couchtop as defined in treatment plan.
4. Move Protura to **Zero Position**.

5. Align patient to external markers.
6. Exit treatment room.
7. Calculate shifts with **OBI System** to align target.

**NOTE**

If patient is not treated with Protura, refer to Section 6.4 Protura Workflow - Varian Integration without Protura.
8. In **OBI System**, click **Save Match** and shift values are saved.

<table>

</tbody>
</table>

**NOTE** Protura software calculates shift values, gets pedestal location from the Varian 4DTC System (with a pedestal 0,0,0 move request), and locks the pedestal in Protura software.

9. Protura displays shift values and **Move** button becomes available.

**WARNING**

- Prior to selecting the **Move** button, verify pedestal and shift values in Protura match the IGRT system values.

10. Click **Move** button to move Protura and send shift data to Varian 4DTC System. The Current Couch Pedestal Location in the Protura software will update with the Varian pedestal Target Position.

**WARNING**

- Verify pedestal position matches Protura move request.
11. In **OBI System**, click **Cancel** and select **No** to apply shifts.

![Image of OBI System with Cancel button highlighted]

12. In **Varian 4DTC System**, click **Apply** to move pedestal with shifts sent from Protura.

![Image of 4DTC System with Apply button highlighted]

13. In **Varian Clinac**, press **Motion Enable** and >> keys to update pedestal position.

![Image of Varian Clinac with Motion Enable highlighted]

14. **Move Successful** message will be displayed in Protura system. Click **Yes** to confirm pedestal shifts have been made and to lock Protura for treatment.

![Image of Protura system with Yes button highlighted]

**NOTE**
A confirmation image is recommended to ensure patient and target are in the desired location before treatment is delivered. When making secondary shifts through the Protura software, the additional shifts will be performed as **All 6 Degrees Protura** with no shifts sent to the pedestal.
15. Ready to Authorize message will be displayed. To exit treatment mode, click UNLOCK.

16. In Varian 4DTC System, click Clear Mode Up, then Mode Up treatment field.

NOTE Protura will lock during treatment with no option to unlock. Unlock option will be available at completion of each treatment field.

17. Follow treatment delivery protocol.

18. Repeat STEPS 15-16 for all treatment fields at isocenter location.

19. Upon completion of treatment at current isocenter location, enter treatment room.

20. For treatment delivery at multiple isocenter locations on current patient:
   1. Select UNLOCK in Protura software.

   ![UNLOCK](image)

   ![Zero Position](image)

   3. Select Unlock Pedestal Values.

   ![Unlock Pedestal Values](image)

   4. Repeat workflow beginning with step 5.
21. **Close** patient in **Varian 4DTC System** and/or **MOSAIQ**.
22. Select **UNLOCK** in Protura software.
23. When treatment is complete select **Load / Unload** button. Protura will move to **Load / Unload** position and automatically close patient record.

![Load / Unload](image)

24. Patient may exit treatment room.
25. Generate **Patient Move Report** in Protura software at completion of treatment. Save report in patient file as defined in site protocol. Reports can be automatically generated upon closing of patient record and stored in defined directory location. **Refer to Section 7.2 Patient Move Report and Section 8.1 System Settings.**
6.4 Protura Workflow - Varian Integration without Protura

This section details workflow using Varian 4DTC System only.

**WARNING**

- Ensure patient record in Varian 4DTC System matches patient record in Protura.
- Treatment authorization to Varian 4DTC System will remain active until Clear Mode Up is selected.

1. With Protura in Load / Unload position, open patient in Varian 4DTC System or MOSAIQ.
   - If selected patient exists in Protura database, patient record will automatically launch in Protura. Patient record configuration must have “Patient Treatment uses Protura” unchecked. Refer to Section 5.1.3 Edit Patient Record.
   - If selected patient does not exist in Protura database, New Patient message will be displayed. Click No to indicate patient is not being treated using the Protura System. Patient record will be added to Protura and will automatically launch.

   ![New Patient Message]

   - Left linac light is blue when a non-Protura patient is loaded.

2. In Varian 4DTC System, Mode Up the set up field.
3. Escort patient into treatment room and immobilize patient on couchtop as defined in treatment plan.

5. Align patient to external markers.
6. Exit treatment room.
7. Calculate shifts with IGRT system to align target.
8. Position patient as needed for treatment:
   - Apply shifts through pedestal.
   - If patient is rotated, use method other than Protura to correct rotations.
   - Re-enter room to reposition patient, re-image patient with updated location.
9. Repeat STEPS 7-8 as needed for accurate patient positioning.
10. In Varian 4DTC System, Mode Up treatment field.
Protura Workflows

NOTE: Protura will be locked for treatment with no unlock option during treatment. Unlock option will be available at completion of each treatment field.

11. Follow treatment delivery protocol.
12. Repeat STEPS 10-11 for all treatment fields at isocenter location.
13. Upon completion of treatment at current isocenter location, enter treatment room.
14. For treatment delivery at multiple isocenter locations on current patient, repeat workflow beginning with step 5.
15. Close patient in Varian 4DTC System and/or MOSAIQ.
16. Select UNLOCK in Protura software.
17. When treatment is complete select Load / Unload button. Protura will move to Load / Unload position and automatically close patient record.

18. Patient may exit treatment room.
6.5 Protura Workflow - Elekta Integration

This section details workflow with Elekta, MOSAIQ and XVI integrations with 6DOF with Protura. In this workflow, Protura is able to monitor pedestal coordinates at all times. Define configurations in Elekta Interface tab (refer to Section 8.6 Elekta Interface Settings).

**WARNING**

- Ensure existing patient in Protura is closed prior to opening new patient in MOSAIQ.

1. With Protura in Load / Unload position, open patient in MOSAIQ System and patient record will automatically launch in Protura.
2. Escort patient into treatment room and immobilize patient on couchtop as defined in treatment plan.
3. Raise pedestal to align patient to external markers.
   - If configuration is set to Auto Load / Zero, Protura will automatically move to Zero Position when pedestal vertical and longitudinal coordinates meet the configured values. Refer to Section 8.6 Elekta Interface Settings.
   - If not configured for Auto Load / Zero, use touch screen in vault to move Protura to Zero Position.

**NOTE**

Current pedestal position is automatically updated and displayed in real time in Protura.

4. Select Lock Pedestal Values in Protura.

5. Exit treatment room.
7. Save shifts in Elekta XVI System and click Import to manually import shift values into Protura.

**WARNING**

- Prior to selecting the Move button, verify pedestal and shift values in Protura match the IGRT system values.

8. Click Move button to move Protura into treatment position.
9. **Move Successful** message will be displayed in Protura. Click Yes to lock Protura for treatment.

![Image of Move Successful dialog box]

**NOTE**

A confirmation image is recommended to ensure patient and target are in the desired location before treatment is delivered. Protura configuration can be set to allow unlocking in treatment mode or the unlock feature can be disabled. Refer to Section 8.6 Elekta Interface Settings.

10. Follow treatment delivery protocol.

11. Upon completion of treatment at current isocenter location, enter treatment room.

12. For treatment delivery at multiple isocenter locations on current patient:

1. Select **UNLOCK** in Protura software.

![Image of UNLOCK button]

![Image of Zero Position]

3. Select Unlock Pedestal Values.

![Image of Unlock Pedestal Values dialog box]

4. Align patient to external markers.

5. Repeat workflow beginning with step 4.

13. **Close** patient record in MOSAIQ.

14. Select **UNLOCK** in Protura software.

15. Lower pedestal.

   • If configuration is set to **Auto Load / Zero**, Protura will automatically move to **Load / Unload** position when pedestal vertical and longitudinal coordinates meet the configured values and patient record will automatically close.

16. Patient may exit treatment room.

17. Generate **Patient Move Report** in Protura software at completion of treatment. Save report in patient file as defined in site protocol. Reports can be automatically generated upon closing of patient record and stored in defined directory location. Refer to Section 7.2 Patient Move Report and Section 8.1 System Settings.
This section details workflow for a Remote Control System (i.e. AlignRT) operating the Protura hardware.

**WARNING**

- When the pedestal is moved from the locked position prior to a secondary Protura rotation, a confirmation image is required after the secondary Protura rotation to verify any residual error is within treatment tolerance.

2. Escort patient into treatment room and immobilize patient on couchtop as defined in treatment plan.
3. Raise pedestal and move Protura to Zero Position using buttons on Protura couch or via Remote Control System.
4. Align patient to external markers.
5. Exit treatment room.
6. Calculate shifts with Remote Control System to align target.
7. Click Move Protura in Remote Control System.
8. Change values to reflect current position of pedestal to match Protura and click Apply in Remote Control System to send current pedestal positions to Protura.
9. Click **Apply** a second time to apply shifts in Protura.

![Send Protura move](image1)

10. Click **Verify** to confirm shifts were applied correctly.

![Verify the Protura](image2)

11. Follow treatment delivery protocol.
12. Upon completion of treatment at current isocenter location, enter treatment room.
13. For treatment delivery at multiple isocenter locations on current patient:
   1. Select **UNLOCK** in Protura software.
3. Select Unlock Pedestal Values.

4. Repeat workflow beginning with step 4.

14. **Close** patient in Remote Control System.

15. Select **UNLOCK** in Protura software.

16. When treatment is complete, move Protura into **Load / Unload** position using buttons on Protura couch or via Remote Control System. Patient record will automatically close.

17. Patient may exit treatment room.

18. Generate **Patient Move Report** in Protura software at completion of treatment. Save report in patient file as defined in site protocol. Reports can be automatically generated upon closing of patient record and stored in defined directory location. Refer to Section 7.2 Patient Move Report and Section 8.1 System Settings.
6.7 Protura Workflow - Remote Control with Linac Integration

This section details workflow for a Remote Control System (i.e. Align RT) operating the Protura hardware with Linac integration.

**WARNING**

- Execution of QA tests is required following any updates to Varian 4DTC, OBI, ARIA, or MOSAIQ systems. Verify shift values calculated by Protura match the shifts generated in the OBI System.
- When making Protura shifts with Varian interface enabled, do not Apply Shifts to pedestal with the OBI System or other non-Protura systems. Protura will not update with new pedestal location, thus rotations will not occur at room isocenter and double shifts are possible.
- Ensure patient record in Varian 4DTC System matches patient record in Protura.
- Treatment authorization to Varian 4DTC System will remain active until Clear Mode Up is selected.
- Ensure existing patient in Protura is closed prior to opening new patient in MOSAIQ.

1. With Protura in Load / Unload position, open patient in Varian 4DTC System or MOSAIQ.

   **FOR VARIAN SYSTEM CONFIGURATIONS:**
   - If selected patient exists in Protura database, patient record will automatically launch in Protura.
   - If selected patient does not exist in Protura database, New Patient message will be displayed. Click Yes to indicate patient will be treated using Protura. Patient record will be added to Protura and will automatically launch.

   ![New Patient Message](image)

   **NOTE:**
   To set indicator if patient will be treated with Protura, refer to Section 5.1.3 Edit Patient Record.

2. Escort patient into treatment room and immobilize patient on couchtop as defined in treatment plan.
3. In linac IGRT System, Mode Up the setup field, as necessary.
4. Raise pedestal and move Protura to Zero Position by one of the following:
   
   ![Zero Position Options](image)

   **CLICK ZERO POSITION IN PROTURA SOFTWARE**
   **CLICK ZERO IN REMOTE CONTROL SYSTEM**

5. Align patient to external markers.
6. Exit treatment room.
7. Calculate shifts with linac IGRT System to align target.

   **NOTE**
   For Elekta system configurations, Lock Pedestal Values in Protura software.

Document State: Released
8. Save shifts in linac IGRT System; these values will automatically populate in Protura.
9. Protura displays shift values and **Move** button becomes available.

**WARNING**

- *Prior to selecting the Move button, verify pedestal and shift values in Protura match the IGRT system values.*

10. Click **Move** button to move Protura into treatment position.

![Move Button](Image)

11. **Move Successful** message will be displayed in Protura system. Click **Yes** to lock Protura for treatment.

**VARIAN SYSTEM MESSAGE**

![VARIAN SYSTEM MESSAGE](Image)

**NON-VARIAN SYSTEM MESSAGE**

![NON-VARIAN SYSTEM MESSAGE](Image)

12. **Ready for Treatment** message will be displayed. System is now locked and ready for treatment.

**VARIAN SYSTEM MESSAGE**

![VARIAN SYSTEM MESSAGE](Image)

**NON-VARIAN SYSTEM MESSAGE**

![NON-VARIAN SYSTEM MESSAGE](Image)

13. In the Remote Control System, **Capture** a new **Reference** image.

**FOR REMOTE CONTROL SYSTEM SHIFTS:** (If no additional shifts are needed, continue with **Step 14**).

- Click **Unlock** to indicate patient is not ready for treatment and additional shifts are needed.

![Remote Control System](Image)
FOR REMOTE CONTROL SYSTEM SHIFTS (Cont.):

- Apply shifts with the Remote Control System.

**NOTE:**
Protura ignores the pedestal position being sent from the Remote Control System. Shift values are imported from the IGRT system and appear as “Current Values” in Protura.

- Click **Move Protura** in Remote Control System.

- Change values to reflect current position of pedestal to match Protura and click **Apply** in Remote Control System. With linac interface enabled, Protura will import and lock the pedestal location when shifts are sent from the Remote Control System.

- Click **Apply** a second time to apply shifts in Protura.
• Click **Verify** to confirm shifts were applied correctly.

![Verify the Protura](image)

• If additional shifts are required from Remote Control system, click **UNLOCK** and repeat Remote Control System Steps. When ready for treatment, continue with **Step 14**.

**NOTE:**
If pedestal is not already locked, Varian system configurations require Mode Up the setup field prior to AlignRT move to allow Protura to capture pedestal location.

A confirmation image is recommended to ensure patient and target are in the desired location before treatment is delivered.

When making secondary shifts through the Protura software, the additional shifts will be performed as **All 6 Degrees Protura** with no shifts sent to the pedestal.

---

**FOR VARIAN SYSTEM CONFIGURATION:**
• In **OBI System**, click **Cancel** and select **No** to apply shifts.

• In **Varian 4DTC System**, click **Cancel** to pedestal move request 0,0,0, which is sent from Protura to access pedestal location.

• **Mode Up** treatment field.

**NOTE:**
Protura will lock during treatment with no option to unlock. Unlock option will be available at completion of each treatment field.

![Protura Authorized](image)
14. Follow treatment delivery protocol.
15. Upon completion of treatment at current isocenter location, enter treatment room.
16. Select UNLOCK in Protura software.
17. For treatment delivery at multiple isocenter locations on current patient:
   1. Move Protura to Zero Position.
   2. Select Unlock Pedestal Values.
   3. Repeat workflow beginning with step 5.
18. When treatment is complete, select Load / Unload button. Protura will move to Load / Unload position.
20. Patient may exit treatment room.
21. Generate Patient Move Report in Protura software at completion of treatment. Save report in patient file as defined in site protocol. Reports can be automatically generated upon closing of patient record and stored in defined directory location. Refer to Section 7.2 Patient Move Report and Section 8.1 System Settings.
6.8 Protura Workflow - File Import

This section details workflow using an Import file in Protura. Imported file will be in ASCII format.

1. Escort patient into treatment room and with Protura in Load / Unload position, immobilize patient on couchtop as defined in treatment plan.

3. Align patient to external markers.

4. Exit treatment room.

5. Calculate shifts using an IGRT system to align target.

6. Export IGRT information to an ASCII data file.

7. At Protura workstation, select Import button for direct access to Import data files. There are several options to initiate the Import button.
   - From the File menu, click Import....
   - Click Import in the Couch Position Panel.
   - Select [Ctrl]+I on the keyboard.

If a patient is not loaded, Import will input patient data. If a patient is already loaded, Import will input IGRT data. Import will verify if imported files match the imported patient. If they do not match, the user is given the option to import or cancel.
8. Select file for import. File is imported and values are populated into **MR Number, First Name, Last Name, Course, Field, Couch Pedestal X Y Z Coordinate** and six IGRT shift values.

![Import Image](image)

**NOTE**

MR Number, First Name and Last Name are required fields to save the patient record. If this information is missing from import file, it will need to be entered *(refer to Section 5.1.1 Create Patient Record)*.

Different oncology information systems and linac vendors use different file formats for exporting data. Please check with CIVCO Customer Service to make sure the file format you are using is supported by Protura.

9. Click in each field of **Current Couch Pedestal Location** screen to confirm displayed values. Select **Lock Pedestal Values**.

![Pedestal Location Image](image)

**WARNING**

- Prior to selecting the Move button, verify pedestal and shift values in Protura match the IGRT system values.

10. Click **Move** button to move Protura into treatment position.

![Move Button Image](image)

11. **Move Successful** message will be displayed. Click **Yes** to lock Protura for treatment.

![Move Successful Image](image)
NOTE A confirmation image is recommended to ensure patient and target are in the desired location before treatment is delivered.

12. Ready for Treatment message will be displayed.

13. Follow treatment delivery protocol.

14. Upon completion of treatment at current isocenter location, enter treatment room.

15. Select UNLOCK in Protura software.

16. For treatment delivery at multiple isocenter locations on current patient:

1. Move Protura to Zero Position.

2. Select Unlock Pedestal Values.

3. Repeat workflow beginning with step 3.

17. When treatment is complete, select Load / Unload button. Protura will move to Load / Unload position and automatically close patient record.

18. Patient may exit treatment room.

19. Generate Patient Move Report in Protura software at completion of treatment. Save report in patient file as defined in site protocol. Reports can be automatically generated upon closing of patient record and stored in defined directory location. Refer to Section 7.2 Patient Move Report and Section 8.1 System Settings.
There are two types of Patient Reports:
• Daily Move Report
• Patient Move Report

Reports can be filtered on both patient and date criteria. These reports can be viewed, printed to paper or saved as PDF for import into other information systems.

1. From the Reports menu, click Generate Patient Reports....

   ![Image of Generate Patient Reports dialog]

   2. Select Report Type option.
   3. Select appropriate Date Range option.
   4. Select appropriate Patient(s) option.

**NOTE**

Date Range defaults to Today.
Multiple contiguous rows can be selected by using [Shift]+click. Multiple non-contiguous rows can be selected by using [Ctrl]+click.

7 Reports

7.1 Daily Move Report

The Daily Move Report is generated when a single date is selected from Date Range option.

Daily Move Report displays:
- Generated Date
- Protura Version
- IGRT Coordinate System
- IGRT Configuration Date
- Moves performed on selected date (grouped by MR number then time)
- Protura Location as defined in System Settings
- Move Date

Patients are separated by shaded header containing IGRT system information.
7.2 Patient Move Report

The Patient Move Report is generated when All or From and To choices (with different dates) is selected from Date Range option.

Patient Move Report displays:
- Generated Date
- Protura Version
- MR Number
- First Name
- Last Name
- Period

For each treatment date:
- IGRT Coordinate System
- IGRT Configuration Date
- Protura Location as defined in system settings
- Move Date
- Moves performed (grouped by patient then location)

The Patient Move Report lists patient moves performed during the selected date range. Patients are separated by shaded header containing patient information.

The Patient Move Report can be set to automatically save a new report to a defined directory each time a patient record is closed and if moves have occurred. Auto Save Reports must be enabled and report will be saved in the defined directory as yyyy-mm-dd_MR#_DailyReport.pdf. Refer to Section 8.1 System Settings.
7.3 Preview Report Overview

Preview Report Window is divided into three parts: Options, Report Body and Find.
I. Options

Options are located in the upper-left corner of the window.

**Saving a PDF**

1. Click PDF icon. **Save As** window is displayed. Update filename and choose appropriate save destination. Click **Save**.

**Print Report**

2. Click Printer icon. **Print** window is displayed. Choose appropriate print options. Click **Print**.

**Copy Selected Text**

3. Highlight text to be copied ([Ctrl]+A selects all text). Click **Copy Selected Text** icon. Paste text into desired application.

**Whole Page / Two Page Across**

4. Change view options by selecting either **Whole Page** or **Two Pages Across** icons.
II. Report Body

This area contains details in the Daily or Patient Move Reports.

**Time:** Recorded time of move.

**Course/Field:** Selected Course and Field for move.

**Last Name/MR #:** Patient's last name and MR # *(Daily Move Report only).*

**Pedestal (cm or mm):** Displays couch pedestal information *(Patient Move Report only).*

**Pedestal Rot (deg):** Displays degrees the pedestal was rotated *(Patient Move Report only).*

**Speed:** Identifies selected move speed *(Patient Move Report only).*

**Translation Start / Stop (cm or mm):** Recorded Start and Stop locations for translation X, Y and Z axes, based upon IGRT Coordinate System used.

**Rotation Start / Stop (deg):** Recorded Start and Stop locations for rotation U, V and W axes, based upon IGRT Coordinate System used.

**Trmt:** Identifies if move resulted in treatment.

### Daily Move Report

### III. Find

Find is located in the lower-left corner of the window. Find allows user to search report by key words. Down arrow allows for different find options.

Type text to find...
The Protura application must be configured according to the specific setup of the treatment facility.

**WARNING**

- Prior to clinical use, alignment is required to set Protura pivot point (refer to Section 8.4 Isocenter Alignment).
- Execution of QA tests is required during Protura installation and IGRT system configuration to assure proper results. Failure to do so can result in patient mistreatment. Always verify shifts through re-imaging and verification and IGRT.
- Protura units are in millimeters and/or centimeters (as defined in Section 8.3 IGRT Coordinate System Configuration and Section 8.2 Couch Pedestal Configuration). Ensure correct values when entered into the system.

From the **Tools** menu, click **Configure**....

The **Configurations and Settings** window is displayed. This panel contains six tabs:

- System Settings
- Couch Pedestal Configuration
- IGRT Coordinate System Configuration
- Isocenter Alignment
- Elekta Interface Settings
- Varian Interface Settings

Configuration tabs are locked when window is opened. Click the **LOCK** to unlock settings.

To leave **Configuration** window without making changes, click **Cancel**.

**Enter Password** window is displayed. There are two methods to enter password:

- Enter password *(default password is CeePro, refer to Section 8.1 System Settings)*. Click **OK**.
- Click the keyboard icon. Enter password using a mouse or touch screen *(default password is CeePro, refer to Section 8.1 System Settings)*. Click **OK**.

**NOTE** Settings cannot be defined or updated if a patient file is open.

To leave **Enter Password** window without making changes, click **Cancel**.
8 Configurations and Settings

8.1 System Settings

System Settings tab contains:

Time Display Format: Sets time display to 12 hour format or 24 hour format.

Patient Data Location: This directory is where all the patient data will be stored. If patient data is being shared among multiple treatment rooms, a shared location accessible by all Protura applications is required. The files in this location are used for generating reports, keeping a daily record of pedestal locations and shifts used for treatment. Click Browse to locate directory.

NOTE Ensure all users have read/write access to directory where data is stored.

Import Files Location: This directory is where the Protura application Import window will default to for importing IGRT move data. Click Browse to locate directory.

NOTE Data formatted in basic printable ASCII format (i.e., Patient Name, MR Number, Course and Field) can be imported from a patient data management system and from an IGRT system (i.e., correction values), eliminating the need to manually enter this data into the Protura System.

Auto Save Reports Location: This directory is where the Daily Reports and Patient Reports will be saved automatically. Click Browse to select directory. This setting is automatically enabled. To disable setting, check the box next to the Disabled indicator.

Import Time Threshold: This value (in minutes) will be used to compare date and time in IGRT import data to the current system time. If IGRT date and time exceed the threshold value, a warning message will be displayed. This is to reduce the chance of using obsolete IGRT data. Valid values range from 0 to 1500.

NOTE A value of “0” will skip the time threshold check.

Protura Default Speed: This value is the default movement speed for new patients and test procedure. The speed options are Low, Medium and High.
Protura Move Delay: This checkbox will delay Protura movement approximately 1.5 seconds after movement is requested. This delay allows time between entering a shift into the software and the actual movement of Protura.

Change Configuration Password: Current password can be changed here. Password field must be at least four (4) characters. This field accepts up to 30 characters and is case sensitive.

- Enter New Password (default password is CeePro).
- Re-enter password into Confirm New Password.
- Click Save.

- Before leaving the Configurations and Settings window, click Save to ensure all changes are saved. To undo any changes made, click Cancel. To leave without making changes, click Close.

Protura Location Name: This value uniquely identifies this particular instance of the Protura installation. If you have more than one Protura in your department, this is where you would name the particular installation or linac room.

Protura Port: This value is the Protura hardware port number. Valid values range from 1 to 65535. This number is uniquely assigned and should not be changed unless instructed by CIVCO Customer Service.

Protura Address: This value is the Protura hardware IP address. If you need to change the IP address for Protura, please contact CIVCO Customer Service.

Remote Control: This checkbox will allow remote systems to connect to Protura and control it. Ensure at least one IGRT configuration has an Access Key (refer to Section 8.3 IGRT Coordinate System Configuration/Remote Access Key) specified prior to defining remote control.

Remote Control IP Address: Value for the Protura workstation IP address to the facility network is selected here. This is the network Protura will communicate with for remote connection.

Remote Control Port: This value is the port number used for connecting remotely. Valid values range from 1024 to 65535.

NOTE When changing any previously saved configuration value, exit and restart the Protura application to apply changes.
**8 Configurations and Settings**

**8.2 Couch Pedestal Configuration**

The **Couch Pedestal Configuration** tab describes couch translation axes. *Only one configuration can be set up per Protura.*

**Axis Label / Order / Direction:** The left image defines couch labels, display order, and to which direction the positive and negative values refer. *Axis labels accept up to five (5) characters and must be unique.* These values should match your Record and Verify system, linac text description and convention. The order should also be matched to minimize errors.

**Extents / Thresholds:** The right image defines the range of motion and threshold values. To define the range of motion for an axis, you must enter in three values: **Start**, **Stop** and **Crossover**. Find the values from the linac coordinate convention. The **Crossover** field is the value where the pedestal range restarts from zero again. Axis threshold value will be used to display a warning when one or more of the current Couch Pedestal Values, included in an IGRT import file or manually entered, differ from the previous move for the course by more than the threshold value defined. **Display Units** drop down list contains cm and mm values and this determines the unit of measure.

**For Example:** a Start of 9,000 with a Stop of 3,000 and a crossover of 10,000 has a linear axis defined to be 9,000 to 10,000, 0 to 3,000.

**NOTE**

A value of “0” will skip the threshold check.
**Pedestal Rotation Compensation**: Defines Pedestal Angle Threshold, Default Couch Pedestal Angle and Angle Rotation.

- **Pedestal Angle Threshold**: This value (*specified in degrees*) will be used to display a warning when the current Couch Pedestal Value, included in an IGRT import file or manually entered, differ from the previous move for the course, by more than the threshold value defined.

  NOTE: A value of “0” will skip the threshold check.

- **Pedestal Rotation Label**: This should match linac text description and convention. *This value accepts up to eight (8) characters.*

- **Couch angle increases when rotated**: Choose from **CW (clockwise)** or **CCW (counter-clockwise)** for angle calculation. Verify intended angle direction is displayed correctly in image.

- **Default Couch Pedestal Angle**: Choose appropriate longitudinal angle for pedestal orientation.

  - Before leaving the **Configurations and Settings** window, click **Save** to ensure all changes are saved. To undo any changes made, click **Cancel**. To leave without making changes, click **Close**.

  NOTE: When changing any previously saved configuration value, exit and restart the Protura application to apply changes.
8.2.1 Couch Pedestal Configuration Relationship

**Current Couch Pedestal Location** *(left image)* are displayed in the following order: Vert, Long and Lat. This display order is defined in **Configurations and Settings** *(right image)*.

From **Tools** menu,
click **Configure**...
click **Couch Pedestal Configuration**.
**Unlock** the settings.
Change Display order for Vert from 1 to 2, Long automatically changes to 1.
Change Display order for Long from 1 to 3 and Lat automatically changes to 1.
**Click Save**.
Changes are displayed on the main window:

**NOTE**
When changing any previously saved configuration value, exit and restart the Protura application to apply changes.
8 Configurations and Settings

8.3 IGRT Coordinate System Configuration

IGRT Coordinate Systems tab is where one or more IGRT Coordinate Systems are defined. The IGRT Coordinate System definition can be configured to match treatment and imaging equipment setup, enabling easy entry of IGRT move data.

- Select different IGRT Coordinate System from drop list.
- Create new system, or edit or delete an existing system.
- Select a current system from the drop list to view configuration settings.

*WARNING*

- The use of an incorrect IGRT Coordinate System can lead to mistreatment. Care should be taken to ensure the correct IGRT Coordinate System is used for each patient. For example, the user may rely on an optical based IGRT system and periodically perform a CBCT for alignment. If the two IGRT systems have different coordinate systems or outputs, the user must make sure the correct system is selected for treatment.
**IGRT Coordinate System:** A new IGRT Coordinate System can be created or a current system can be edited or deleted.

**CREATE NEW SYSTEM:**
Click **Create New System** to create a new system.
Enter required data.
Click **Save** once all information is completed.

**EDIT:**
Select system from drop down list.
Click **Edit** to change configuration settings.
Click **Save** once all information is completed.

**DELETE:**
Select the IGRT Coordinate System from drop down list to be deleted.
Click **Delete**.
A window will display to confirm deletion. Click **OK**.

**Remote Access Key:** Allows an approved remote system to connect with Protura. Move data will be reported using this IGRT configuration. *This field accepts up to 10 characters and must be unique.*

**Rotation Order:** Determines the order of axis rotation. Drop down list contains all X-Y-Z value combinations.

**Angle Type:** Determines the type of angle. Drop down list contains **Fixed** and **Euler** values.

**Display Units:** Determines the unit of measure. Drop down list contains **cm** and **mm** values.

**Translation Axis Labels / Order** and **Rotation Axis Labels / Order:** Values can be entered into axis labels, display order Translation Direction can be selected. *Axis labels accept up to five characters and must be unique.*

**IGRT Coordinate System Name.** *This field accepts up to 20 characters and must be unique.* Default system can be set by selecting checkbox by **Set as Default System.**

**NOTE**
Changing the **IGRT Coordinate System Name** requires a restart of Protura to see the new name.
IGRT Coordinate System Data Type: Drop down list contains Offsets and Absolute values. When Offsets data type is selected, values entered in Proposed Values section of the main window will be relative to the current Protura position. When Absolute data type is selected, values entered in Proposed Values section of the main window will indicate absolute coordinate values for Protura movement.

Couch Rotation Compensation: Checkbox determines if Protura shifts will be applied in relation to room coordinates or in relation to pedestal coordinate frame when pedestal is in a rotated position. Check the box if IGRT data source is compensating for couch pedestal rotation. When checkbox is not selected, Protura will compensate for the couch pedestal rotation.

- Before leaving the Configurations and Settings window, click Save to ensure all changes are saved. To undo any changes made, click Cancel. To leave without making changes, click Close.

NOTE

When changing any previously saved configuration value, exit and restart the Protura application to apply changes.
8 Configurations and Settings

8.3.1 IGRT Coordinate System Relationship

This example illustrates how to change prompts on the main window for Proposed Values. Axis labels can be changed here.

**Proposed Values** *(left image below)* are displayed in the following order: VERT, LNG, LAT, YAW, PITCH, and ROLL. This display order is defined in **Configurations and Settings** *(right image below).*

From **Tools** menu, click **Configure**...
- click **IGRT Coordinate Systems**.
- Unlock the settings.
- Select **IGRT Coordinate System** from drop list, click **Edit**.

Change Display order for VERT from 1 to 3, LAT automatically changes to 1.
Change Display order for ROLL from 3 to 2 and PITCH automatically changes to 3.
Click **Accept System**. Click **Save**.
Changes will be displayed on the main window:

---

**NOTE**
When changing any previously saved configuration value, exit and restart the Protura application to apply changes.
8 Configurations and Settings

8.3.2 Override IGRT Data Type (Absolute or Relative Coordinates)

Current System Settings can be overridden for the following attributes on a per patient and per treatment basis. **IGRT Coordinate System** Data types are Absolute or Offset Coordinate values.

**NOTE**
Relative will switch the IGRT system to Offsets.

**WARNING**

- *When a relative move is interrupted, the Proposed Values do not reflect the remaining move position. Users must confirm the patient is in the correct position prior to starting treatment.*

IGRT Data type defines whether or not the coordinates in the Proposed Values fields are absolute values (from Zero Position) or relative to the current position of Protura hardware.

1. From the Tools menu, click Override IGRT Settings.
2. IGRT Data types are listed above the divider. The current data type is indicated by a check mark. Select the IGRT Data type to use.
3. Confirm the main window reflects the updated IGRT Data type in Patient Move Panel and status bar.

**NOTE**
Data type selection is typically made in the configuration section of Protura *(refer to Section 8.3 IGRT Coordinate System Configuration).*

**WARNING**

- *Overriding system setting should be carefully considered and performed only by trained users of the system.*

8.4 Isocenter Alignment

Displays the Alignment Data entered on the main window in read-only format *(refer to Chapter 3 Alignment).*

Isocenter Alignment tab can be used as a quick reference for retrieving pedestal alignment information.

**NOTE**
When changing any previously saved configuration value, exit and restart the Protura application to apply changes.
8 Configurations and Settings

8.5 Varian Interface Settings

Varian Interface Settings tab is where the Varian Interfaces are defined. The 4DTC Interface checkbox should be checked if Protura is installed on a Varian linac with Auxiliary Device Interface (ADI).

If ARIA is the record and verify system being used, leave MOSAIQ checkbox unchecked.

If MOSAIQ record and verify system is being used, MOSAIQ checkbox must be checked.
8 Configurations and Settings

8.5.1 Varian 4DTC Interface

**4DTC Address** (or Varian MICAP), **Port**, and **DICOM** or **MOSAIQ** information must be added. With Varian 4DTC Interface, enabled, the following things occur:

- The interface will allow the Protura System to connect to the Varian ADI as a 3rd party auxiliary system.
- This connection will provide Protura with Patient Open, Mode Up, Clear Fields, Clinac Ready options.
- Will allow Protura to Authorize treatments and Request Pedestal Moves.
- The **4DTC Pre V13 checkbox** must be selected when using Varian 4DTC versions prior to Version 13. This allows Protura to accurately authorize treatment fields in the Varian environment when changing 4DTC versions.
- The **OBI Pre V1.6 checkbox** must be selected when using Varian OBI versions prior to Version 1.6. This allows Protura to accurately import and apply shifts as defined in the OBI system. The Pitch and Roll sign conventions (+/-) will change with OBI Version 1.6 in the Varian environment. Therefore, the **Protura IGRT Coordinate System** must also be updated when changing the selection of this checkbox. Refer to Section 8.3 IGRT Coordinate System Configuration.
- The **STD Scale checkbox** must be selected when using Varian Standard Scale. This allows Protura to accurately import the pedestal location when using Varian Standard Scale.
- Right linac light is green when connection is enabled.
- Both linac lights are green when Protura has found registration files.
- Left linac light is yellow and right linac light is green when Protura is transferring data.
- Left linac light is blue and right linac light is green when linac is connected with a non-Protura patient is loaded.
- Right linac light is red when linac is not connected.
- Left linac light is red when DICOM is not connected.

**WARNING**

- Verify connection to the correct 4DTC System.
**Division of Movement:** This is a system setting and not for individual patients. Three settings are available; **All 6 degrees Protura**, **Translation Pedestal / Rotation Protura**, or **Translation and Yaw Pedestal / Pitch and Roll Protura**. Once Protura is connected to the Varian System and shift values are populated in the Proposed Values fields, the Division of Movement setting will determine which system executes the specified shift values when Move is selected.

- **All 6 degrees Protura** will send all six shift values to the Protura hardware.
- **Translation Pedestal / Rotation Protura** will split shifts between the Protura hardware and pedestal move request to the 4DTC.
- **Translation and Yaw Pedestal / Pitch and Roll Protura** will split shifts between the Protura hardware and pedestal move request to the 4DTC.

**NOTE**

When selecting one of the split shift options, Protura is not notified by 4DTC if or when the pedestal executes requested shift. The user should follow workflow defined in Section 6.3 Protura Workflow - Varian Integration with Pedestal Shifts.

When making secondary shifts through the Protura software, the additional shifts will be performed as **All 6 Degrees Protura** with no shifts sent to the pedestal.

**IGRT Coordinate System:** This will define the coordinate frame for the Varian Interfaced System.

**DICOM:** This connection information is required for Protura to access registration data sent from the OBI when configured for use with ARIA record and verify system. **Address, Port, Server AE Title, Local AE Title, and Local Port** must be entered to connect Protura to the ARIA record and verify system.

**MOSAIQ:** This connection information is required for Protura to access registration data sent from the OBI when configured for use with MOSAIQ record and verify system. **Server Address, DB Name, User Name, Password, Department, DICOM Path and Import Path** must be entered to connect Protura to the MOSAIQ record and verify system.
8 Configurations and Settings

8.6 Elekta Interface Settings

**Elekta Interface Settings** tab is where the Elekta interfaces are defined. This interface will provide pedestal location and course/field information for the currently loaded patient.

![Elekta Interface Settings](image)

### 8.6.1 Elekta Interface

When the **Elekta Interface** checkbox is **Enabled**, the following things occur.

- Couch pedestal values are automated with current pedestal locations when a patient record is open, pedestal values are unlocked and Protura is not in the **Load / Unload** position.
- System will automatically answer **Yes** to a successful move when the linac signals a treatment segment has started.
- The **Unlock** option will be displayed when the linac interrupts a treatment segment.
- An optional interface is active between the Touch Guard System and the Protura System so when the Touch Guard is activated, Protura movement stops.
- Linac button is green when connection is enabled.
8 Configurations and Settings

**WARNING**

- When Linac status button is red, users must ensure the Couch Pedestal Values are correct.

**NOTE**

Elekta Workstation Address: Contains the IPv4 address for which Protura will receive communication messages from the Elekta linac. *This field accepts up to 15 characters.*

Auto Load / Zero: Check box only if Elekta interface is enabled.

**WARNING**

- When changing Auto Load/Zero configuration, verify auto movement system functioning with desired cross-over thresholds based on site treatment protocols. Failure to do so could result in unexpected Protura movement.

Vertical Unload Start Threshold: The field precision is 0.1mm. Once the pedestal moves away from the linac and across the Longitudinal Load threshold the Vertical Load threshold moves Protura to Load / Unload position.

Vertical Zero Threshold: The field precision is 0.1mm. While the pedestal is away from the linac and is across the Longitudinal Load threshold the Vertical Zero threshold moves Protura to Zero Position.

Longitudinal Load Threshold: The field precision is 0.1mm.

Allow Unlocking in Treatment Mode: Check box only if Elekta interface is enabled. User is allowed to unlock Protura to exit treatment mode when enabled.

**NOTE**

Pedestal location is not automatically updated during alignment procedure. When Touch Guard is configured, the Load / Unload button and Zero Position button on Protura are disabled. These motions remain available in Protura software.

If connection with the Touch Guard system is lost, activation of the Touch Guard does not prevent Protura movement.

8.6.2 MOSAIQ Interface

When the MOSAIQ Interface checkbox is Enabled, Protura is able to have “read access” to the MOSAIQ database application directory. This interface allows Protura to monitor the MOSAIQ workstation sending treatment data to detect patient loading and unloading when the pedestal values are not locked. When a patient is loaded on the MOSAIQ workstation, the patient will be automatically loaded onto the Protura System if they already exist. If they do not exist on Protura then the database will be queried to get the patient information and a patient record will be created.

MOSAIQ Workstation ID: Contains the MOSAIQ workstation unique ID number. *This field accepts up to 10 characters.*

MOSAIQ Database Connection: Defines connection string necessary to communicate with MOSAIQ database. *This field accepts up to 255 characters.*

MOSAIQ PATID File Location: Defines MOSAIQ “application directory”.

**NOTE**

When interfaced with the MOSAIQ System, any patient record automatically created in the Protura database will be automatically deleted at the end of patient treatment only if the Protura was not used to correct patient’s treatment position (i.e., no shift information is saved for patient record).
8 Configurations and Settings

8.6.3 XVI Database Interface

When the XVI Database Interface checkbox is Enabled, Protura is able to have read access to the XVI database. When import is selected, the following will occur:

- Protura will display, in the Proposed Values fields, the new shift data for the loaded patient. This data should be verified against the XVI data. The Move button must be selected to accept the Proposed Values.

NOTE: There is an indicator change from (+) to (-) or from (-) to (+) between the XVI System and the Protura System.

XVI Database Connection: Defines the connection string necessary to communicate with the XVI database. This field accepts up to 255 characters.

IGRT Coordinate System: Defines the coordinate frame for the XVI Interfaced System.

WARNING

- Execution of QA Test Localization Accuracy is required for each IGRT system when changing the system configuration. Do not operate Protura in the event of errors.

NOTE: When changing any previously saved configuration value, exit and restart the Protura application to apply changes.

8.7 Remote Control Settings

The Protura system can be configured to allow an IGRT Coordinate System to remotely control Protura workflows.

1. Enable and identify the Remote Control system.
2. In the System Settings tab in Configurations and Settings, select the Remote Control checkbox.
3. Enter the Remote Control IP Address and Control Port.

Remote control requires a Remote Access Key and is entered in the IGRT Coordinate Systems tab in Configurations and Settings. (Refer to Section 8.3 IGRT Coordinate System Configuration).

NOTE: When AlignRT is used as the remote system, ensure the IGRT Coordinate System Data Type is set to Offsets. (Refer to Section 8.3 IGRT Coordinate System Configuration).

Prior to launching the IGRT system software, ensure the Protura System is powered on and launched.

WARNING

- Execution of QA Test Localization Accuracy is required for each IGRT system when changing the system configuration. Do not operate Protura in the event of errors.
1. From the Configuration window determine the location of patient data for Protura.

2. Open My Computer and navigate to the patient data location.

If your site has an MR number format containing unfriendly file system characters, you may end up with multiple <MR Number>’s appearing the same (refer to the top three files in the illustration below).

</table>

To verify the correct patient for backup, close Protura application, open directory and view PatientData.xml file using a web browser.

3. Select the directories and copy them onto a network drive for backup or onto a CD-R to burn on your system.

To restore patients from backup location: prior to copying the entire patient directory, ensure patient is not open in software and remove existing version in the patient data directory.

11.1 Touchscreen Configuration

For Planar Touchscreens:

Consult Touchscreen CD for additional features.
1. Click Start and point to All Programs, TouchKit, Configure Utility. Administrative password may be required.
2. Select Tools tab, 4 points calibration and follow on-screen instructions.
3. Click OK when complete.

Default for touchscreen is set for a beep to sound with each touch. To turn beep sound off:
1. Select Settings tab.
2. Click Beep On Touch, Beep On Release, and Beep From Sound Card checkboxes to disable.
3. Click OK when complete.

Default for touchscreen is set to “Enable Auto Right-Click.” To disable:
1. Select Settings tab and click Option.
2. Clear Enable Auto Right Click checkbox.
3. Click Apply, then click OK.

For Elo Touchscreens:
1. Click Start, then Control Panel Elo Touchscreens.
2. Select Align button.
3. Select OK.

Default for touchscreen is set for a beep to sound with each touch. To disable:
1. Select Sound tab.
2. Click Beep to disable.
3. Click OK.

11.2 Quality Assurance Test Procedure

Periodic Protura Quality Assurance is essential to prevent mechanical and configuration errors. Mechanical errors could result in incorrect positioning. Configuration errors pertain to inadvertent changes to information in the Protura System and/or IGRT Configuration Settings. The following section outlines the Quality Assurance Test Procedure for validating elements of the localization process.

Quality Assurance should be done quarterly.
Quality Assurance should be repeated after every software upgrade or any change to a system that affects localization accuracy.

11.2.1 Mechanical Maintenance

The Protura system includes a Test Procedure (refer to Chapter 4 Test Procedure) which commands the Protura robotic couchtop through a defined range of motion. Execution of this Test Procedure will ensure the robotic gears and motors are lubricated and functioning properly. The automated test will take several minutes to run based on the default Protura move speed.
11.2.2 Isocenter Alignment

The Protura system features a virtual pivot point. Any rotational corrections to the couch position are executed with isocenter as virtual pivot / reference point. Protura alignment assures the virtual point will be calculated properly with respect to isocenter. The Protura software includes an Align Pedestal Configuration which is used to assign a known Protura coordinate position to the pedestal location (refer to Chapter 3 Alignment). This procedure will take 10 to 15 minutes to complete.

11.2.3 Localization Accuracy

The Protura Robotic Couch System is intended to provide sub millimeter patient positioning accuracy. Quality Assurance should be performed to ensure the system is functioning within this tolerance.

CIVCO recommends the following two methods for inspecting position accuracy. The first test verifies Protura moved to known locations. The second test verifies Protura motion while simulating patient repositioning. Both tests are verifying a phantom moved to an intended location, so one or both test methods can be used for Quality Assurance.

1. Verify Protura moves to known locations.
   - Make measured shifts shown below with phantom on couchtop. Make each shift as a separate move and document the IGRT output.

Measured Shifts:

<table>
<thead>
<tr>

11 System Maintenance

2. Verify Protura moves with simulated patient repositioning.

   Validate CT image acquisition and TPS marker coordinate import:
   1. CT scan phantom (1 mm slices or better of CIVCO Alignment Block or one of your choice) in the null position.
   2. Import scans into treatment planning software.

   Protura shifts and rotations applied:
   1. Launch Protura.
   2. Create new QA patient (or open an existing QA patient).
   3. Make sure IGRT system loaded in Protura represents IGRT system you are using during QA Procedure.
   4. Enter shifts and rotations generated in IGRT system into Protura.
   5. Select Move.
   6. Verify shifts and rotations bring phantom to isocenter within acceptable tolerance levels (+/- 1mm, +/- 0.2 degree).

11.3 Reprocessing

WARNING

- Users of this product have an obligation and responsibility to provide the highest degree of infection control to patients, coworkers and themselves. To avoid cross-contamination, follow infection control policies established by your facility.

Wipe all surfaces with common germicidal or antiseptic wipe, such as alcohol. Take care when cleaning device to ensure no fluids come in contact with internal robotic components.

NOTE
Moisture and cleaning fluids can cause malfunctioning of the robotics system.

11.4 Maintenance

Device has no user serviceable parts. Opening shell and skirt (bellows) can lead to serious injury, including crushed limbs and electric shock which could result in death. Only trained service technicians and installers should ever open the system. Contact CIVCO Customer Service.

WARNING

- Inspect device prior to use for signs of damage and general wear.
- Device should not be opened or serviced during operation or while power is plugged in.
- Device should only be serviced by authorized personnel.
